

# Two stage proportional directional valves

digital, pilot operated, open loop, with **positive spool overlap**

## DPZO-A, DPZO-AEB, DPZO-AES

Pilot operated digital proportional valves without position transducer and with positive spool overlap, for open loop directional controls and not compensated flow regulations.

Executions:

- **A** without integral driver, to be coupled with separated drivers, see section 2
- **AEB** with basic integral digital electronic driver, analog reference signals and USB port for software functional parameters setting
- **AES** with full integral digital electronic driver and fieldbus interface for functional parameters setting, reference signals and real-time diagnostics

The integral digital electronic driver performs the valve's hydraulic regulation according to the reference signal and assures valve-to-valve interchangeability thanks to the factory presetting.

Size: **10 to 32**

Max flow: **180 to 1600 l/min**

Max pressure: **350 bar**

## 3 GENERAL NOTES

DPZO-A\* proportional valves are CE marked according to the applicable Directives (e.g. Immunity/Emission EMC Directive and Low Voltage Directive). Installation, wirings and start-up procedures must be performed according to the general prescriptions shown in table F003 and in the installation notes supplied with relevant components.

## 4 FIELDBUS - only for AES

Fieldbus allows the direct communication of the proportional valve with machine control unit for digital reference signal, diagnostics and settings of functional parameters. Analog reference signal remain available on the main connector for quick commissioning and maintenance. For detailed information about fieldbus features and specification see tech table **GS510**.

## 7.3 Response time (measured at pilot pressure = 100 bar)

The response times in below diagrams are measured at different steps of the reference input signal. They have to be considered as average values. For the valves with digital electronics the dynamics performances can be optimized by setting the internal software parameters.

## 7.4 Operation as throttle valve

Single solenoid valves (\*51) can be used as simple throttle valves:

$P_{max} = 250$  bar

For this application, the use of valve -TEB or -TES (see tab. FS172) is advisable (consult our technical office)

Max flow [l/min] $\Delta p = 30$ bar	320	850	1400	2000

## 8 HYDRAULIC OPTIONS

### 8.1 Option /B

DPZO-\*-5 = solenoid and integral electronics at side of port B of the main stage.

DPZO-\*-7 = integral electronics at side of port B of the main stage.

### 8.2 Options /E and /D

Pilot and drain configuration can be modified as shown in section 15

The valve's standard configuration provides internal pilot and external drain.

For different pilot / drain configuration select:

Option /E External pilot (through port X).

Option /D Internal drain.

### 8.3 Option /G

Pressure reducing valve installed between pilot valve and main body with fixed setting:

DPZO-1 and -2 = 40 bar

DPZO-4 and -6 = 100 bar

It is advisable for valves with internal pilot in case of system pressure higher than 150 bar.

## 9 OPTIONS for -A

### 9.1 Coil voltage

**Option /6** optional coil to be used with Atos drivers with power supply 12 VDC

**Option /18** optional coil to be used with electronic drivers not supplied by Atos

## 10 ELECTRONIC OPTIONS for AEB and AES

Standard driver execution provides on the 7 pin main connector:

**Power supply** - 24 VDC must be appropriately stabilized or rectified and filtered; **2,5 A** fuse time lag is required in series to each driver power supply. Apply at least a 10000 µF/40 V capacitance to single phase rectifiers or a 4700 µF/40 V capacitance to three phase rectifiers

**Reference input signal** - analog differential input with ±10 VDC nominal range (pin D, E), proportional to desired coil current

**Monitor output signal** - analog output signal proportional to the actual valve's coil current (1V monitor = 1A coil current)

**Note:** a minimum booting time of 500 ms has been considered from the driver energizing with the 24 VDC power supply before the valve has been ready to operate. During this time the current to the valve coils is switched to zero.

### 10.1 Option /I

It provides 4 ÷ 20 mA current reference signal, instead of the standard ±10 V.

Input signal can be reconfigured via software selecting between voltage and current, within a maximum range of ±10 V or ±20 mA.

It is normally used in case of long distance between the machine control unit and the valve or where the reference signal can be affected by electrical noise; the valve functioning is disabled in case of reference signal cable breakage.

### 10.2 Option /Q

To enable the driver, supply 24 Vdc on pin C referred to pin B: Enable input signal allows to enable/disable the current supply to the solenoid, without removing the electrical power supply to the driver; it is used to maintain active the communication and the other driver functions when the valve has to be disabled. This condition does not comply with European Norms EN13849-1 (ex EN954-1).

### 10.3 Option /Z

It provides, on the 12 pin main connector, the following additional features:

#### Enable Input Signal

To enable the driver, supply 24 Vdc on pin 3 referred to pin 2: Enable input signal allows to enable/disable the current supply to the solenoid, without removing the electrical power supply to the driver; it is used to maintain active the communication and the other driver functions when the valve has to be disabled. This condition does not comply with European Norms EN13849-1 (ex EN954-1).

#### Fault Output Signal

Fault output signal indicates fault conditions of the driver (solenoid short circuits/not connected, reference signal cable broken for 4÷20mA input, etc.). Fault presence corresponds to 0 VDC, normal working corresponds to 24 VDC (pin 11 referred to pin 2): Fault status is not affected by the Enable input signal

#### Power supply for driver's logics and communication

Separate power supply (pin 9,10) allow to cut solenoid power supply (pin 1,2) while maintaining active diagnostics, USB and fieldbus communication.

A safety fuse is required in series to each driver power supply: 500 mA fast fuse.

### 10.4 Option /W - only for valves coupled with pressure compensator type HC-011 or KC-011 (see tab. D150).

It provides, on the 12 pin main connector, the above option /Z features plus the hydraulic power limitation function.

The driver receives the flow reference signal by the analog input INPUT+ and a pressure transducer, installed in the hydraulic system, has to be connected to the driver's analog input TR.

When the actual requested hydraulic power  $p \times Q$  (TR x INPUT+) reaches the max power limit ( $p1 \times Q1$ ), internally set by software, the driver automatically reduces the flow regulation of the valve. The higher is the pressure feedback the lower is the valve's regulated flow:

$$\text{Flow regulation} = \text{Min} \left( \frac{\text{PowerLimit [sw setting]}}{\text{Transducer Pressure [TR]}} ; \text{Flow Reference [INPUT+]} \right)$$

**For detailed information on hydraulic power limitation, see tab. GS115**

### 10.5 Option /C - only in combination with option /W

Option /C is available to connect pressure transducer with 4 ÷ 20 mA current output signal, instead of the standard 0 ÷ 10V.

Input signal can be reconfigured via software selecting between voltage and current, within a maximum range of ±10 V or ±20 mA.

### 10.6 Possible combined options: /IQ, /IZ, /IW, /CW and /CWI

## 14 PROGRAMMING TOOLS - see tech table GS500

Valve's functional parameters and configurations, can be easily set and optimized using Atos E-SW programming software connected via USB port to the digital driver. For fieldbus versions, the software permits valve's parameterization through USB port also if the driver is connected to the central machine unit via fieldbus.

The software is available in different versions according to the driver's options:

**E-SW-BASIC** support: NP (USB) PS (Serial) IR (Infrared)  
**E-SW-FIELDBUS** support: BC (CANopen) BP (PROFIBUS DP) EH (EtherCAT)  
 EW (POWERLINK)

**E-SW-\*/PQ** support: valves with SP, SF, SL alternated control (e.g. E-SW-BASIC/PQ)

**WARNING: drivers USB port is not isolated!**

The use of isolator adapter is highly recommended for PC protection (see table GS500)

## 15 PLUGS LOCATION FOR PILOT/DRAIN CHANNELS

Depending on the position of internal plugs, different pilot/drain configurations can be obtained as shown below. To modify the pilot/drain configuration, proper plugs must only be interchanged. The plugs have to be sealed using loctite 270. Standard valves configuration provides internal pilot and external drain.

Drain channels

**Internal piloting:** Without plug ①;  
**External piloting:** Add DIN-908 M16x1,5 in pos ①;  
 Add plug SP-X325A in pos ②;  
**Internal drain:** Without blinded plug SP-X300F ③;  
**External drain:** Add blinded plug SP-X300F ③.

To reach the orifice ② remove plug ④ = G1/8"
